CUTEDODO

Paws. Community. Purpose.

CuteDoDo (DODO) | Project Whitepaper

Inspired by the real Dodo. Built around a proposed pet-loving community, transparent animal welfare and useful digital experiences on Solana, including a proposed Liquid NFT pathway and metaverse pet shop.

MEET DODO / THE HEART OF CUTEDODO

TOKEN IDENTITY | SOLANA MINT ADDRESS

2e5bKRHpAixvgE6zUdTf7rigxCq662zq7xvN8Dympump

VERSION 2.3 • 31 OCTOBER 2026 • PUBLICATION REVIEW DRAFT

Not an investment offer, price forecast, audit opinion or regulator-approved crypto-asset white paper.

PUBLICATION STATUS

Before you read

This is a founder-review draft with explicit evidence boundaries, not a representation that proposed products already exist.

MATERIAL RISK STATEMENT

DODO is a highly speculative cryptoasset. Its value may decline substantially or become zero; liquidity and transferability may be limited; and products discussed in this paper may never launch. Buying DODO does not purchase equity, guarantee services or confer a right to profits.

EVIDENCE CLASS	WHAT IT MEANS
OBSERVED	A dated explorer/market-tracker reading for the exact mint. It may change and is not a full audit.
PROJECT-STATED	A claim in the project narrative or token metadata, not independently validated.
PROPOSED	A design, goal or roadmap target. It has not been delivered or independently funded.
REQUIRES SIGN-OFF	A material unanswered question needing founder records, verification or legal clearance.

Publication control

ITEM	STATUS
Responsible legal entity and officers	Not supplied. To be named and verified before public release.
Founder-held and related-party wallets	Unknown. A 240M-token figure previously discussed is not verified.
Global welfare 1% funding mechanism and eligible recipients	Global animal-welfare intent stated; calculation base, custody and evidence need written founder approval.
Token audits, governance rights, services	No independent service audit or binding token-holder rights established in this draft.
Legal review	Required in the target jurisdictions; this document is not a MiCA-compliant filing.

Sources and evidence dates are in the reference register. Market statistics are intentionally excluded from the cover because they change rapidly.

CONTENTS

Whitepaper map

A concise technical and operating plan for an early-stage token, not an investment sales document.

01—07	PROJECT & TOKEN
01	Executive summary and the purpose behind CuteDoDo
02	Problem, design principles and proposition
03	DODO ecosystem: Paws / Club / Shop / future DODO World
04	Token identity: observed attributes and claims
05	Tokenomics, beneficial ownership and reserves
06	Utility design: what DODO does and does not do
07	Economics and a viable revenue model

08—14	IMPLEMENTATION & ASSURANCE
08	Technical reference architecture and payment controls
09	Seven core phases + gated Liquid NFT / metaverse extensions
10	DODO Paws: global veterinary care, health and wellness
11	Community, governance and communication rules
12	Security, privacy, resilience and risk
13	Compliance considerations and limitations
14	Evidence dashboard, dependencies and references

DESIGN THESIS

Start with real pet-community value and transparent charitable activity. Prove reliable fulfilment before adding optional DODO transactions. Build trust through published evidence, not token-price narratives.

01 / EXECUTIVE SUMMARY

The CuteDoDo proposition

The real Shih Tzu pictured on the cover gives CuteDoDo an approachable identity. Long-term credibility must still be earned through useful experiences, transparent operations and verifiable outcomes.

CuteDoDo (DODO) is an existing Solana token linked to a pet-centred meme narrative. Its public metadata references a Shih Tzu named Dodo, a 1% pet-charity intention and zero token tax. These claims do not themselves establish an operating charity, funded allocation or financial utility. [1–3]

This whitepaper proposes an incremental platform serving pet owners, animal-welfare groups and merchants, with later proposed Liquid NFT and metaverse extensions subject to demand, assurance and funding. CuteDoDo would offer an open community, documented charitable projects and a small real-product commerce operation. The existing DODO token would remain optional: a separate access or settlement layer may be introduced where it adds measurable utility and is legally permissible.

What this project proposes

PILLAR	CUSTOMER OUTCOME	DELIVERY RULE
DODO Paws	Discover legitimate rescue initiatives and verify the use of contributions.	Verify partners and donation transfers before publishing impact claims.
DODO Club	Participate in pet stories, education and community activities.	Free core access; robust moderation and privacy.
DODO Shop	Purchase useful pet merchandise and receive reliable fulfilment.	Fiat-priced commerce first; DODO option only after testing.

What creates credibility

- Disclosed treasury and founder-controlled wallets, with no invented allocations or unverified vesting claims.
- Evidence-based welfare reporting and an operating business that can support its costs.
- Milestones that pass product, security, legal and financial acceptance criteria.
- Plain-language market and project risks, with no promise of token returns.

NON-GOAL

CuteDoDo is not being positioned as a stablecoin, investment fund, yield-bearing product, guaranteed asset appreciation mechanism or substitute for a registered charity.

02 / THE PROBLEM

Why a pet community needs more than a token

Meme culture can attract attention, but trustworthy animal welfare and repeat customer value require more than speculation.

Three challenges

1. Fragmented attention: online communities often produce short-lived engagement with little durable service value.
2. Donation trust: donors may struggle to distinguish fund collection, actual external payment and demonstrated animal-welfare outcomes.
3. Commerce friction: pet owners value practical goods, clear pricing, consumer rights and dependable delivery—not mandatory wallet setup.

Design response

CHALLENGE	DESIGN PRINCIPLE	MEASURE
Trust deficit	Public, source-linked evidence ledger.	% disbursements with recipient confirmation
Engagement decay	Meaningful content and recurring pet events.	30-day returning active members
Token-first friction	Free participation and fiat-first checkout.	Completed orders and customer satisfaction
Concentration risk	Beneficial-owner disclosure and treasury controls.	Controlled-wallet register updated monthly

The intended product is a community and services brand. A functioning application is not evidence that token prices will rise; token value depends on market supply, demand, liquidity and trader behaviour beyond the project's control.

ACCESSIBILITY AND SAFETY

No DODO purchase is required to read pet-care information, engage with animal-welfare campaigns or directly support eligible partner shelters. Pet adoption is a welfare decision, not a token-gated financial transaction.

03 / ECOSYSTEM

The CuteDoDo ecosystem

One coherent brand, three foundational services and future Liquid NFT / metaverse extensions. Token benefits must be additive, voluntary and understandable.

One brand | Three useful services

DODO PAWS	DODO CLUB	DODO SHOP
Verified welfare partners Donation evidence Real-world outcomes	Pet profiles & stories Moderated community Optional member benefits	Physical products Fiat-first commerce Optional DODO checkout

DODO participation is optional • No purchase required to support animals

Practical operating sequence

1. DODO Paws begins with partner due diligence, donation links or approved donation collection routes, and publicly evidenced outcomes.
2. DODO Club launches with moderated stories, pet profiles, events and educational resources without wallet requirements.
3. DODO Shop begins as a small conventional store with returns, shipping and consumer-service processes.
4. Only after stable operation, selected customers may opt into DODO-denominated settlement or non-financial membership benefits.

PRODUCT BOUNDARIES

These products are proposed. This paper does not claim that a shop, community platform, verified charity partnership or wallet-enabled checkout has already launched.

04 / TOKEN IDENTITY

DODO on Solana

Exact mint identity is verifiable. Time-dependent balances and inferred control relationships require qualification.

ATTRIBUTE	REFERENCE FINDING	CONFIDENCE
Name / symbol	CuteDoDo / DODO	Explorer-observed [2]
Mint address	2e5bKRHpAixvgE6zUdTf7rigxCq662zq7xvN8Dympump	Exact user-supplied identifier [2]
Network / program	Solana; original SPL Token Program	Explorer-observed [2]
Decimals	6	Explorer-observed [2]
Current supply snapshot	961,091,257.148174 DODO	Solscan display; dynamic [2]
Mint / freeze authority	Scanner reports both revoked; Solscan displays Authority N/A	Third-party observation, recheck [2,3]
Creation / venue	Market tracker records PumpSwap launch on 26 Oct 2026	Tracker-observed [3]

Market and holder snapshots are not tokenomics

CoinUFO displayed approximately 253 holders and approximately 3.7% in the identified creator wallet in its 29 October market snapshot. Another provider displays different and/or stale values. Holder counts depend on time and methodology. A creator-wallet balance cannot establish all beneficial holdings controlled by the founder. [3,4]

What cannot yet be stated as fact

- That the founder owns 240 million DODO: not verifiable from the mint address alone.
- That all early allocations are independently owned, locked, vested or circulating.
- That “1% pet charity” is currently funded or automatically collected on every trade.
- That all liquidity positions or reserve accounts are controlled by independent parties.

05 / TOKENOMICS

Supply, allocation and beneficial ownership

A credible tokenomics page displays the evidence available and refuses to manufacture a clean-looking but inaccurate allocation pie chart.

Supply is observable. Ownership needs disclosure.

961,091,257.148174	1,000,000,000	38,908,742.851826
Solscan supply snapshot	Initial issuance claim	Arithmetic difference
EXTERNALLY OBSERVED	PROJECT-STATED	CAUSE UNVERIFIED

No confirmed on-chain allocation chart can be produced until controlled wallets, LP positions and vesting records are reconciled.

Reported creator wallet balance does NOT equal total founder beneficial ownership.

Minimum founder disclosure schedule

ITEM	WHAT MUST BE PUBLISHED
Supply reconciliation	Mint-account supply, initial issuance record, confirmed burn transactions, snapshot date and method.
Related-party addresses	Founder, team, multisig, treasury, market-making, charitable, vesting and other controlled wallets.
Allocations	Actual token amounts and percentages by beneficial controller—not merely wallet labels.
Locks / vesting	On-chain escrow contract or reputable verifiable locker, schedule, control and unlock terms.
Liquidity	Pool addresses, LP token ownership, custody, lock terms, market and counterparty risk.
Global 1% welfare allocation	Defined 1% calculation base, custody, approved countries/partners, approvals and disbursement proof.

INTERPRETATION OF THE 1% CLAIM

If the project ultimately commits 1% of a one-billion-token initial issuance, that would be 10 million tokens; however neither that allocation nor its custody is proved by the available sources. The founder must approve and evidence the definitive policy.

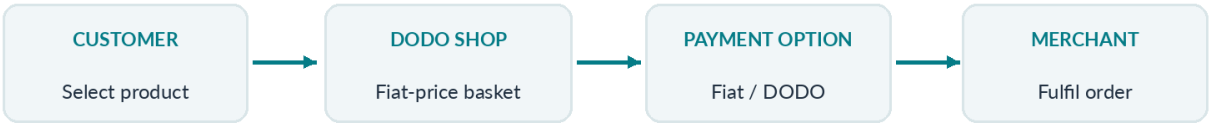

06 / DODO UTILITY

Optional uses of the existing token

The token is not the product. Any utility should create customer choice, transparent execution and measurable user benefit.

PROPOSED UTILITY	HOW IT MAY WORK	KEY CONTROL
Optional checkout	Wallet-approved DODO payment for a fiat-priced merchandise order.	Clear rate, quote expiry, refund policy and chain verification.
Optional member benefits	Eligibility for selected events or community badges tied to wallet ownership.	Free alternatives for essential features; no financial return promise.
Community nominations	Signalled preference on eligible welfare topics.	Non-binding unless voting charter explicitly delegates authority.
Collectibles / rewards	Limited non-financial badges for participation, if users want them.	No misleading reward yield or paid-for popularity manipulation.

Proposed purchase and settlement paths

If DODO checkout is enabled:
quote → wallet approval → on-chain confirmation → order reconciliation

The merchant defines settlement and refund terms. No promised token price support.

A shopper buying DODO to spend and a merchant selling received DODO can offset each other economically. Gross transaction volume is not net token demand. No automatic buyback, burn, yield or fee redistribution is promised in this proposal.

07 / ECONOMIC MODEL

Sustainable operations without token-price assumptions

CuteDoDo should be financially useful even if the token does not appreciate.

Potential revenue and cost sources

SERVICE	POTENTIAL REVENUE	MAJOR COSTS
DODO Shop	Gross margin on fulfilled physical goods.	Inventory, supplier cost, shipping, returns, tax, customer support.
DODO Club	Optional sponsorships or paid events, if appropriate.	Moderation, hosting, privacy, creative content.
DODO Paws	Not assumed to be a profit centre.	Due diligence, audit evidence, payment processing and reporting.
Partnerships	Disclosed sponsor fees or merchant referrals.	Account management, campaign operations and compliance.

Illustrative unit economics (not a forecast)

For a hypothetical £20 merchandise order, a 35% gross margin contributes £7 before payment charges, fulfilment, returns, customer acquisition, overhead and taxes. The product is economically viable only if the fully loaded contribution margin is positive and repeat purchases justify acquisition costs.

Treasury controls

- A named budget owner approves commitments; a second approver signs disbursements above a published threshold.
- Operational income, any developer-controlled token assets and restricted donations are accounted for separately.
- Quarterly disclosures show beginning balances, receipts, spending, open commitments and ending balances.
- No promise that shop revenue is used to buy tokens, support prices or compensate holders.

INCENTIVES DISCIPLINE

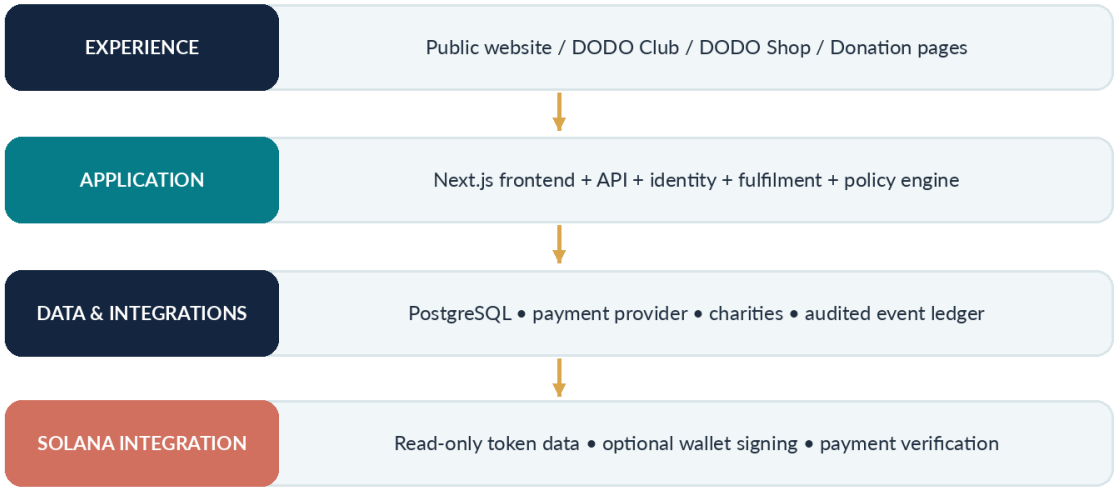

Rewards should initially be non-tradable loyalty benefits with a cost cap; launching token-funded incentives requires documented funding, abuse controls, consumer analysis and legal review.

08 / TECHNOLOGY

Reference implementation architecture

A conventional product foundation with limited, carefully verified Solana interaction.

Reference architecture | MVP without a custom token contract

Cross-cutting: encryption • logging • rate limits • KYC/AML where required • incident response

Minimum implementation stack

Client: accessible Next.js/React experience with optional Solana wallet connection. API: typed Node.js services for authentication, catalogues, order creation, policy checks and reconciliation. Data: PostgreSQL for operational state; immutable audit records for payment and donation evidence. Deployment: hardened managed hosting with secure secrets, monitoring and backups.

Chain interface: read the verified DODO mint and token-account balances through reputable RPC providers; use the existing SPL Token Program. No new token issuance or unaudited custom contract is needed for the MVP. [5,6]

ARCHITECTURAL DECISION

Keep pet profiles, shopping-cart data, addresses, consent and invoices off-chain. Store only the minimum public wallet and transaction references needed for verification. Never accept or retain users' seed phrases or private keys.

08 / TRANSACTION ASSURANCE

How an optional token purchase would work

Commerce can fail even when a blockchain transfer succeeds; the application needs clear state, reconciliation and refund policy.

1. Create an order at a clear fiat price and disclose accepted payment methods, consumer rights and costs.
2. If the buyer selects DODO, issue a time-limited quoted token amount using a documented pricing source and maximum slippage bound.
3. Have the buyer approve a non-custodial wallet transaction to the merchant-designated token account for the exact mint.
4. Verify server-side: signature, expected mint, recipient, amount, confirmation state, duplicate signature and expiry.
5. Only then mark the order paid and send a fulfilment instruction; record the signature and reference source.
6. For reversals, apply disclosed fiat-referenced refund rules, including currency and timing risk, without implying guaranteed redemption.

Failure-handling controls

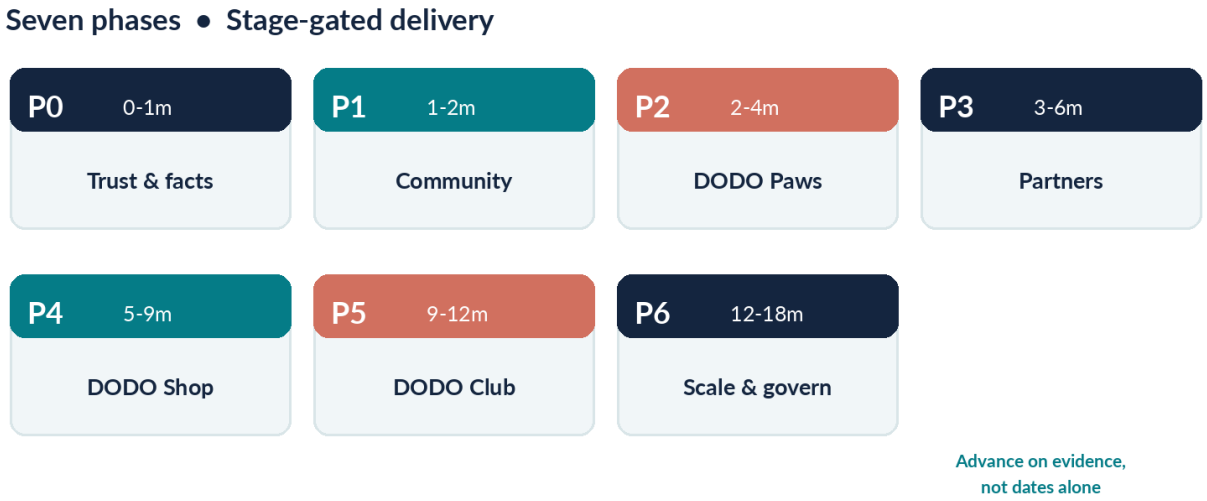

FAILURE CASE	DESIGN RESPONSE
Rate changes / expired quote	Reject or re-quote; do not silently alter the price.
Wrong token or recipient	Never fulfil based on wallet screenshots; inspect actual on-chain records.
Transaction succeeds; API times out	Idempotent reconciliation job finds confirmation and closes the order.
Chain outage or insufficient liquidity	Offer conventional checkout; avoid indefinite customer lock-in.
Customer support / returns	Human-accessible dispute channel and clear refund eligibility.

Final payment implementation depends on legal advice, provider support and an end-to-end pilot. Official Solana payment documentation describes appropriate signing and confirmation patterns. [6]

09 / DELIVERY PLAN

Seven core phases + two Liquid NFT / metaverse extensions

Windows are estimates from project initiation, not guaranteed dates. A gate fails if evidence is absent even when the scheduled window ends.

Decision gates applied to every phase

GATE	DEFINITION OF DONE
Product	Feature is deployed, usable by independent testers and documented.
Commercial	Operating budget and service economics are accepted by the named accountable owner.
Security & privacy	Threat model, access controls, incident response and consent assessed.
Compliance	Marketing, payments, donation collection and data processing routes cleared.
Evidence	Public milestone proof and changes to previously stated plans are published.

CHANGE CONTROL

Any scope or timeline change should create a dated roadmap revision with rationale, new dependencies and affected milestones. Upcoming features are ambitions until shipped and verified.

09 / PHASED DELIVERY

Foundation and community

Phase 0 and Phase 1 create the conditions for safe participation before significant promotion or commerce.

PHASE 0 | Weeks 0–4 | Identity, treasury and governance foundation

Deliver: Publish authoritative contract links; reconcile supply; map and attest related-party wallets; correct website inconsistencies; establish donation definition; name project officers; publish risk FAQs and change log.

Exit evidence: Signed wallet register, source-linked token factsheet, founder-controlled allocation statement, consent and incident policies, approved content checklist.

Owner / dependency: Project lead + independent verifier; founder records, wallet-signature proof and legal reviewer.

PHASE 1 | Months 1–2 | Community and repeatable trust signals

Deliver: Launch single official link hub; moderated X/Telegram/Discord; original pet content; public community rules; recurring founder Q&A; simple pet-owner onboarding and analytics.

Exit evidence: Operational moderators, real member engagement, no paid bot campaigns, published monthly transparency note and a defined complaint route.

Owner / dependency: Community lead + moderator team; Phase 0 transparency and platform rules.

Working cadence

FREQUENCY	NON-PRICE DELIVERABLE
Daily	Original pet story or practical community content; moderated discussion.
Weekly	Operational update, one open question, false-claim correction where needed.
Monthly	Holder-count methodology, treasury disclosure and progress versus milestones.

NO PROMOTION SHORTCUTS

Do not use fake reviews, wash trading, undisclosed wallet clusters, coordinated pumps, misleading “no rug” guarantees or price-target advertisements.

09 / PHASED DELIVERY

Welfare proof and partner distribution

Phase 2 and Phase 3 convert goodwill into measurable programmes with defensible claims.

PHASE 2 | Months 2–4 | DODO Paws pilot

Deliver: Select 1–2 independently verified rescue partners; agree funds-handling policy; launch public cause pages; run a small controlled campaign; publish transaction and recipient evidence.

Exit evidence: At least one disbursement documented separately from a wallet receipt, with recipient confirmation and an impact update; no unsupported tax-deductibility claims.

Owner / dependency: Welfare lead + approved charity/NGO liaison; donor-fund legal process and Phase 0 custody approvals.

PHASE 3 | Months 3–6 | Brand partners and transparent discovery

Deliver: Pilot pet creators, shelters and merchants; disclose every paid relationship; maintain accurate DEX directories; publish brand/mascot usage rules and partner directory.

Exit evidence: Executed written agreements, campaign disclosures, measurable qualified traffic, complaint log and evidence that partner promises were delivered.

Owner / dependency: Partnership lead + compliance reviewer; community guidelines and partner due diligence.

Partner diligence checkpoints

- Confirm organisation identity, beneficial control and bank/crypto payment destinations.
- Check animal-welfare credentials and how the partner will evidence results.
- Obtain explicit approvals for name, logo, photos, testimonials and sensitive pet-owner information.
- Define cancellation, reputational escalation, support responsibilities and reporting duties.

09 / PHASED DELIVERY

Commerce and optional token utility

Phase 4 and Phase 5 must justify their existence through repeat customers and safe, testable customer journeys.

PHASE 4 | Months 5–9 | DODO Shop MVP

Deliver: Launch a tightly scoped physical-goods catalogue with fiat checkout, shipping policies, returns, seller identity, customer support, supplier onboarding and order analytics.

Exit evidence: Real fulfilled orders, documented returns, payment reconciliations, positive unit contribution and an accessible support route before token checkout work begins.

Owner / dependency: Commerce/product lead + finance; supplier contracts, stock/fulfilment arrangements, consumer-rights review.

PHASE 5 | Months 9–12 | DODO Club and optional payments

Deliver: Expand authenticated pet profiles and community activities; test opt-in wallet linking; pilot limited DODO checkout with transaction verification and quote/refund controls.

Exit evidence: Independent penetration review, privacy impact assessment, successful test-purchase reconciliation, monitored fraud rates and a documented opt-out path.

Owner / dependency: Engineering lead + privacy/compliance; Phase 4 stable operations and merchant acceptance.

Do not ship until...

RELEASE STOP CONDITIONS

Delay token checkout if liquidity is inadequate for fair quoting, if refund terms are unclear, if legal obligations cannot be met, if wallet transactions cannot be independently verified, or if data/security tests fail.

09 / PHASED DELIVERY

Operational scale and governance maturity

Phase 6 is earned through established real-world service performance, not a token market-cap milestone.

PHASE 6 | Months 12–18 | Reliability, governance and partnerships

Deliver: Assess product-market fit; expand vetted merchant/charity partnerships; introduce formal budget planning, public service reports, disaster recovery exercises and structured community input.

Exit evidence: Six-month operating history with transparent financial metrics, verified partner outcomes, independent security review and a fully maintained public documentation library.

Owner / dependency: Accountable governance group + independent advisers; sustained revenue, good compliance and partner capacity.

Post-Phase 6 options - not commitments

- City-specific pet community chapters and welfare events.
- Optional merchant integrations that make DODO acceptance simpler, if customers demand it.
- Open APIs for approved charity evidence or merchant status checks.
- More sophisticated community nomination mechanisms with explicit legal scope.

Conditions for responsible expansion

The organisation should avoid expanding into lending, staking, profit-sharing, investment products, exchange services or automated market-making without separate business approval, regulatory analysis and security assurance. No token burn/buyback schedule is included in this roadmap.

EXIT CRITERIA OVER TIMETABLES

Every phase is a provisional plan. Failure to meet an acceptance condition should result in transparent delay or scope reduction rather than an unsupported “launched” claim.

09 / PHASED DELIVERY • OPTIONAL EXTENSIONS

Liquid NFT and metaverse expansion gates

Two additional, proposed phases extend the original seven-stage delivery plan. They are contingent projects—not funded launches or promises of asset liquidity.

PHASE 7 | Months 12–16 | DODO Liquid NFT Genesis and market readiness

Objective: deliver a modest, recognisable Liquid NFT collection featuring the real Dodo, with practical membership benefits. Pilot a small run only after evidence that the DODO Club and Shop can honour those benefits.

WORK PACKAGE	DELIVERABLE / ACCEPTANCE EVIDENCE
Product + rights	Define artwork permissions, unique traits, supply ceiling, pricing, buyer rights, metadata policy and holder benefits; publish complete terms.
Technical pilot	Mint test assets using a supported Solana NFT standard as the foundation for the proposed Liquid NFT collection; test wallet connections, transfers, metadata persistence and ownership checks.
Public pilot	Offer a limited Genesis collection only after security and compliance approval; publish actual mint numbers, holder feedback and benefit-redemption outcomes.
Liquidity review	Measure real secondary-market bids and fills; complete a separate risk assessment before considering automated liquidity arrangements.

PHASE 8 | Months 15–24+ | CuteDoDo virtual pet shop

Objective: lease or acquire a suitable virtual parcel in an established metaverse, subject to cost, platform usage, title/licence due diligence and exit conditions. Build a branded, accessible 3D pet showroom connected to genuine fulfilment services.

WORK PACKAGE	DELIVERABLE / ACCEPTANCE EVIDENCE
Site selection	Compare platform users, land/lease rights, costs, technical compatibility, moderation, accessibility, vendor risk and support for off-platform checkout.
Experience pilot	Launch a Dodo-themed virtual storefront with pet accessories, educational stations, optional Liquid NFT gallery and a link to normal checkout.
Operations + proof	Test real orders, returns and customer support. Report meaningful visits, repeat visitors, fulfilled orders and partner participation, not virtual land price.

GATE PRINCIPLE

Proceed to either phase only if independent demand, a funded operating budget, legal clearance, a measured success case and an approved contingency/closure plan exist.

09 / DIGITAL COLLECTIBLES • PROPOSED

CuteDoDo Liquid NFT: ownership with purpose

STATUS AND SCOPE | The proposed CuteDoDo Liquid NFTs are not yet issued. The initial pilot would use ordinary Solana NFT infrastructure for unique collectibles and membership rights; any secondary-market or pooled-liquidity mechanisms would be separately evaluated, tested, disclosed and approved before launch. No redemption, floor price, buy-back, or continuous liquidity is promised.

The real Dodo mascot provides the creative foundation for optional Solana collectibles. The Liquid NFT is a digital asset; its utility depends on real experiences delivered by CuteDoDo.

Proposed DODO Genesis and Paws Pass collections

DESIGN ELEMENT	PROPOSED IMPLEMENTATION
Digital assets	Original Dodo-inspired artwork, unique metadata and clear permission to display or use the art; no unlicensed third-party pet images.
Membership benefits	Optional event admission, physical merchandise offers, pet-story showcases and community recognition; publish expiry and transfer terms.
Animal-welfare connection	Dedicated collection campaigns may reference verified rescue partners and link to transparent donation reporting; do not imply Liquid NFT sales automatically fund charity.
Token relationship	Existing DODO token may be accepted as an optional payment method after commercial and technical testing. Liquid NFTs do not create a new DODO supply or investment right.

Illustrative customer journey

Discover official collection → review price and rights → connect a supported wallet → mint or buy Liquid NFT → verify ownership through the CuteDoDo app → claim an available non-financial benefit or visit the DODO virtual shop.

Product and technical safeguards

- Use an established Solana NFT infrastructure framework (such as Metaplex Core) to create the proposed Liquid NFT collection, subject to compatibility and independent security review. “Liquid NFT” describes the planned liquidity features—not a distinct Solana token standard. [12]
- Define smart-contract / metadata control, creator permissions, treasury custody, refund disclosures, phishing protection and independent code review.
- Begin with a pilot quantity rather than promising 1,000 sales; make any edition cap and release schedule binding only when formally published.
- Do not promise royalties from every resale, permanent discounts, yield, staking return or a rising resale floor.

STATUS DISCLOSURE

No CuteDoDo Liquid NFT collection, Liquid NFT entitlement or sale price is represented here as already launched. Collection supply and economics are founder decisions pending validation.

09 / Liquid NFT MARKET DESIGN • SUBJECT TO REVIEW

Liquid NFT: what it can—and cannot—mean

"Liquid NFT" is the proposed CuteDoDo product label for a collectible NFT coupled with potential mechanisms that may improve market access or trading liquidity. It is not a separate Solana token standard, an existing feature, or a guarantee of a buyer. CuteDoDo will distinguish simple marketplace tradability from evidenced exit liquidity and from financialised arrangements.

STEP	WHAT WE WOULD INTRODUCE	CONTROL / PASS CRITERION
A. Secondary trading	List eligible Liquid NFTs on supported marketplaces so owners can post offers and respond to bids.	Confirm marketplace compatibility, fees, verified collection IDs and actual bid depth.
B. Market insights	Publish observed offers, completed sales, owner distribution and time-to-sale.	Distinguish asking prices from real transactions; no invented floor or guaranteed redemption.
C. Feasibility of Liquid NFT pools	Only if justified, study Liquid NFT automated market makers / pooled bids or buy-back facilities.	Independent technical, treasury, tax, legal and liquidity review; no launch solely to support a price.
D. Advanced structures	Fractionalisation or Liquid NFT-backed lending are out of initial scope.	Separate regulatory analysis and security audits; no automatic deployment.

Liquidity risk and economics

A tradable Liquid NFT may still have zero executable bids. Liquidity providers can lose capital, market makers can withdraw, and pools can expose treasury assets to volatility, arbitrage and smart-contract exploits. A resale or buy-back guarantee is not proposed.

Success metrics: adoption rather than speculation

- Unique legitimate collectors; active benefit redemptions; repeat participation in DODO Club and Shop.
- Observable resale executions, bid/ask depth and typical time to sale, reported with dates and trade counts.
- Liquid NFT support costs, customer complaints, scam incidents and treasury exposures, reviewed monthly.

COMPLIANCE GATE

Tokenised fractional interests, investment-style promises and Liquid NFT lending can alter the legal classification of an arrangement. Assess the real rights and market behaviour, not only the Liquid NFT label. [13]

09 / VIRTUAL COMMERCE • PROPOSED

DODO World: a metaverse pet shop

CuteDoDo proposes to establish a branded virtual destination where visitors can meet Dodo, explore pet-related products, learn about welfare programmes and access real-world services.

Virtual land acquisition: investment decision

The project intends to consider buying or leasing a metaverse parcel, but no parcel, platform or purchase has been approved. “Virtual land” typically means a platform-defined digital licence or asset—not ownership of physical property. Rights, transferability and ongoing platform survival must be reviewed before funds are committed.

ZONE	VISITOR EXPERIENCE	BUSINESS / SOCIAL PURPOSE
Dodo welcome plaza	Meet the real Dodo mascot and learn the project story.	Accessible onboarding and a trustworthy official link hub.
CuteDoDo Pet Shop	Explore 3D pet toys, collars, clothing and merchandise.	Checkout leads to a verified real-world retailer with prices, returns and fulfilment.
Liquid NFT gallery / club	View genuine Dodo collectibles and optional token-gated events.	Display rights and member benefits; no implied resale value.
Global DODO Paws corner	Visit approved rescue stories and verified treatment / health / wellness projects.	Country-labelled donation receipts, recipient confirmation and impact reporting.

Practical platform architecture

Visitor browser or supported headset → 3D experience/virtual parcel → linked CuteDoDo web portal → identity and optional wallet verification → normal commerce platform or approved donation route → reporting dashboard. No medical, payment-card or personal data should be stored in Liquid NFT metadata.

Pilot sequence and exit policy

First test a low-cost hosted demo before any land purchase. If usage is demonstrable, negotiate rights and a fixed budget, launch a time-boxed virtual pop-up, then decide whether to buy/lease a permanent venue. Preserve website-first access and an exit plan if the platform closes or loses users.

MEASUREMENT

Track qualified visitors, engaged minutes, product views, actual fulfilled orders, verified welfare referrals and repeat visits. Do not use speculative virtual-land appreciation as a success measure.

10 / ANIMAL WELFARE

DODO Paws: global health, treatment and wellness

CuteDoDo intends a global programme supporting pet treatment, health and wellness. Charitable impact requires traceable financial and delivery evidence. Tokens arriving in a wallet are not equivalent to funds reaching a shelter.

Five verifiable stages

STAGE	RECORD	PUBLIC STATUS
1. Policy	Defined donation source, currency, eligibility, restricted use and approvers.	Policy approved
2. Receipt	Bank receipt or blockchain transaction showing controlled funds received.	Received - not yet donated
3. Approval	Recorded review of partner identity, purpose, amount and conflicts.	Approved for payment
4. Transfer	External payment transaction and recipient acknowledgement.	Paid to recipient
5. Outcome	Partner update/receipt and practical welfare result, where available.	Confirmed outcome / pending proof

Interpret the proposed 1% carefully

CuteDoDo proposes to dedicate 1% to animal welfare initiatives globally, including treatment, health and wellness. The current “1% pet charity” statement does not yet specify whether this refers to token supply, revenue, profits or treasury receipts. Before public fundraising or quantified impact claims, the responsible entity must approve the precise funding base, contribution cadence, custody, geography, conversion policy and independent evidence process. A 0% additional token tax cannot by itself fund automatic donation revenue. [3]

NON-NEGOTIABLE PROTECTIONS

No fabricated donation receipts; no combining internal wallet movements with external charity payments; no claims of formal charitable partnership without approval; no assumption that a buyer receives a personal tax deduction.

10 / GLOBAL ANIMAL WELFARE • 1% PROPOSED ALLOCATION

DODO Paws: care without borders

CuteDoDo intends to allocate 1% under an approved and published funding policy to eligible animal-welfare work around the world. Geographic reach is an ambition; verified programmes should be introduced country by country.

Prioritised use of the global welfare allocation

AREA OF CARE	ELIGIBLE EXAMPLES	OUTCOME EVIDENCE
Treatment	Veterinary consultations, surgery, medicine, urgent diagnostics and rescue stabilisation.	Itemised provider invoice, anonymised case update and settlement proof.
Preventive health	Vaccination, parasite prevention, sterilisation where appropriate and screening.	Partner programme statement and treatment / outreach counts.
Wellness & recovery	Nutrition, shelter, rehabilitation, mobility support and post-treatment care.	Partner receipts, delivery records and follow-up outcome where safe.
Emergency response	Approved rescue and treatment assistance after disasters or serious local incidents.	Due-diligence record, transaction confirmation and partner report.

How the 1% commitment will be operationalised

Before any quantified fundraising claim, the responsible entity must specify exactly what 1% applies to (for example, defined eligible shop revenue or another approved funding source), when it is calculated, who controls the funds, the donation currency and the verification process. Do not treat 1% as a transaction tax or an automatic on-chain deduction unless actually implemented and audited.

Global grants and publication controls

- Select legally eligible organisations across regions using documented identity checks, conflicts review and veterinary/welfare competence.
- Use controlled bank or blockchain settlement with dual approval; publish amounts, dates, currencies, beneficiary countries and independent receipts.
- Publish a quarterly country-by-country ledger showing the opening balance, 1% accrual, payments, outstanding commitments and verified outcomes.
- Protect the identities and images of pet owners, children and rescuers; secure consent for animal case stories.

STATEMENT OF INTENT—NOT PROOF OF PAYMENTS

The 1% figure and global beneficiaries represent the proposed programme, not verified historic disbursements. Formal charity partnerships, funding base and distribution policy remain pending founder approval.

11 / COMMUNITY & GOVERNANCE

Community influence with accountable decision rights

A token balance alone does not establish a binding governance right. Actual authority belongs to the named project controllers until valid rights are formally created.

Proposed accountability structure

FUNCTION	ACCOUNTABILITY
Founder / responsible entity	Disclosure accuracy, strategy, budget, legal and partner obligations.
Treasury signatories	Documented payments, wallet policies, reconciliation and public reports.
Product and technology lead	Availability, product assurance, custody boundaries and privacy.
Welfare steward	Partner diligence, restricted funds and impact evidence.
Community moderators	Code of conduct, scam protection, feedback routing and incidents.

Community participation model

A proposal forum may gather project ideas and rank eligible activities. Any poll should show the voters eligible to participate, voting method, whether votes are advisory or binding, conflicts and the actual final decision. Avoid describing a centralised platform poll as on-chain DAO governance.

Distribution and responsible marketing

- Publish original pet content and transparent progress updates on X, TikTok/Instagram and community channels.
- Use clearly labelled sponsorships with pet-focused creators; assess the laws applicable to each market.
- Prioritise verified visitors, returning participants, charity evidence and order fulfilment over raw follower and trader counts.
- Maintain pinned contract, scam warnings, support links and a public corrections log.

12 / SECURITY & DATA

Protect customers, wallets and the project treasury

The reference architecture favours familiar security controls and minimises the number of operations that can move tokens.

RISK DOMAIN	MINIMUM CONTROL
Wallet compromise	Hardware-backed treasury keys where possible, multisig for shared funds, least privilege, incident playbook.
Impersonation	Official mint link everywhere, domain controls, verified social identity and anti-phishing guidance.
Application compromise	Dependency scanning, MFA for admins, secrets manager, WAF/rate limits, pentest before payments.
Incorrect payments	Explicit mint and recipient checks, server-side chain validation, signature deduplication, reconciler.
Personal data	Data minimisation, legitimate purposes, retention controls, encrypted storage, access/deletion requests.
Service disruption	Backups, incident communications, retry queues and a fiat checkout fallback.
Merchant fraud	Supplier due diligence, buyer support, refunds and dispute procedures.

Security architecture decisions

No private key or seed phrase is ever collected from a user. Client wallets sign their own transactions; server-side payment confirmation is independently evaluated. Services are separated by role so that public analytics components cannot initiate transfers from treasury wallets.

Independent assurance

The original SPL token standard is distinct from any new application code. An audit of one does not certify the other. Commission risk-based external assessment of all deployed wallet payment code, smart programs (if any), authentication and third-party integrations before launch.

12 / RISKS

Principal risks and limitations

No risk scan or lock badge eliminates market, governance or execution risk.

RISK	POSSIBLE CONSEQUENCE	MITIGATION / DISCLOSURE
Speculation and thin liquidity	Rapid price collapse, slippage, inability to exit.	Prominent warnings, no price promises, do not equate market cap with cash invested.
Beneficial-owner concentration	Large sales or conflicts of interest.	Verified wallet register, related-party disclosure, custody and vesting evidence.
Roadmap failure	Services may be late, cancelled or uneconomic.	Stage gates, change log and operating budget.
Charity reputation	Unverified partner activity or mistaken impact claims.	Partner diligence and independent receipts.
Wallet/contract compromise	Loss of funds, payment disputes.	Non-custodial design, external review and response plans.
Regulatory restrictions	Marketing or product design may need to change.	Jurisdiction-specific advice before campaigns and payment launches.
Data misuse	Privacy harm and compliance cost.	Consent, minimal collection and deletion procedures.

NO PROTECTION OF VALUE

DODO is not backed by a fiat reserve, insured deposit or statutory investor compensation scheme. A decision to acquire or hold it may result in a total loss. The proposed utility services may not become available.

13 / COMPLIANCE

Regulatory scope and consumer protection

A visually sophisticated paper does not itself satisfy offering, promotion, charity, consumer or data-protection obligations.

United Kingdom

The FCA financial-promotion regime can apply to qualifying cryptoasset promotions capable of having an effect in the UK, including online communications. Promoters should determine an authorised lawful route and any required warnings, customer checks and controls before publishing invitations to buy DODO. The UK is preparing a further cryptoasset regulatory regime scheduled to begin in October 2027. [7,8]

European Union

The EU Markets in Crypto-Assets Regulation (MiCA) may require specified information about the offeror, project, asset, rights, technology, risks, and sustainability. Relevant filings can require particular wording, notification and machine-readable iXBRL formatting. This working project whitepaper is not a notified MiCA document. Applicability must be assessed by qualified EU counsel. [9,10]

Other relevant requirements

- E-commerce: seller identity, local taxes, delivery and returns, consumer remedies and accessible checkout.
- Charitable claims: lawful fundraising model, records for restricted funds, recipient approval and audit trail.
- Privacy: UK GDPR/GDPR or local equivalents where applicable, particularly for images and child-related content.
- Influencer campaigns: clearly disclose sponsorships and avoid prohibited financial-return claims.

PUBLICATION GATE

Do not promote this as a regulator-approved whitepaper, legal prospectus, licensed charity fundraising scheme, security audit or investment opportunity. Obtain a named responsible entity, dated management approval and tailored counsel review.

14 / PUBLIC SCORECARD

How progress should be demonstrated

Measure user benefit and operational performance. A token-price target is not a defensible project delivery metric.

CATEGORY	QUARTERLY PUBLISHED INDICATOR	EVIDENCE
Transparency	Wallet/owner map completeness; supply reconciliation status.	Signed declarations + source links.
Community	Returning members; moderation incidents resolved.	Privacy-preserving activity summaries.
Animal welfare	Funds received, external disbursements and confirmed outcomes.	Transactions, receipts and partner attestations.
Commerce	Fulfilled orders, refunds, support response, contribution margin.	Reconciled ledgers and management reports.
Token usage	Independent optional payments; failed/settled transaction rate.	Chain references + anonymised order audit.
Security	Critical issues, patch lead time, exercises and independent reviews.	Dated security attestations.
Financial health	Burn rate, funded runway, restricted funds separated.	Management-controlled reconciliation.

How a milestone becomes “achieved”

1. Name the accountable owner and acceptance test.
2. Attach evidence: production URL, functioning demo, receipt, signature or independent confirmation.
3. Record verification date and any conditions or limitations.
4. Update the change log and preserve prior versions.

Suggested metrics are a reporting design, not current project results. No customer count, financial return, sales revenue or charitable outcome is represented here as already achieved.

PUBLICATION REGISTER

Open decisions and required proof

The final signed whitepaper must resolve these questions instead of hiding them in attractive diagrams.

PRIORITY	REQUIRED ACTION	PUBLISHABLE EVIDENCE
CRITICAL	Identify offeror/operator, jurisdiction and accountable officials.	Legal-entity details and management sign-off.
CRITICAL	Provide every founder/related-party and treasury wallet.	Wallet address list and signed-control attestations.
CRITICAL	Explain stated 1B vs observed 961.09M supply.	Reproducible on-chain transaction reconciliation.
CRITICAL	Ratify the global 1% funding base, country eligibility and custody; demonstrate funding.	Signed 1% policy, partner register, receipt ledger and actual external transfers.
HIGH	Document LP ownership, Liquid NFT resale disclosures and any future liquidity-pool exposure.	Pool addresses, LP balances and lock proof.
HIGH	Correct all conflicting live-vs-prelaunch marketing copy.	Updated website and cross-channel link register.
HIGH	Approve roadmap budgets and commercial targets.	Owner-approved phase business cases.
HIGH	Review crypto promotions, payments, charity and privacy rules.	Jurisdiction-specific written compliance assessment.
MEDIUM	Commission prelaunch security assessment for wallet checkout.	Test report and remediation evidence.

OWNER APPROVAL CHECKLIST

Do not release version 2.0 as the official final whitepaper until the named publisher has signed a declaration that the information is fair, clear, non-misleading, current and complete in all material respects.

SOURCES & DEFINITIONS

Evidence and glossary

The document intentionally uses exact mint-specific sources and distinguishes dated observations from unverified descriptions.

Selected terms

Mint: the unique token identifier. Circulating supply: an analytic category subject to methodology, not simply the number of minted units. Beneficial control: effective ability to direct assets across one or more wallets. LP: liquidity-pool position. Fiat: sovereign-issued currency. Stage gate: documented acceptance criteria before a phase advances. Liquid NFT: a non-standard commercial term describing proposed resale-liquidity arrangements; it does not guarantee buyers. Metaverse parcel: virtual platform-defined asset or licence, not physical real estate.

VERSIONING

This draft supersedes the previous project working draft as a writing proposal only. Founder-approved changes must be timestamped, retained and reflected consistently across the official website and social channels.
